

Additional file 1. *Fak56* mutant alleles and expression

(A) Illustration of the *Fak56* locus and flanking genes (indicated by arrowed boxes). The *KG00304* insertion was mapped at the 5'-UTR region of *Fak56* [28] and was used to generate imprecise excision lines. From 2,100 independent lines, 34 lines that deleted *Fak56* and the neighboring *Spt5* gene were obtained. The lethal *N30* allele, which deletes a 3030-bp chromosomal region including 2157 bp of *Fak56*, 240 bp of the shared promoter region, and 633 bp of *Spt5*. *N30* homozygotes were embryonic lethal due to the lack of *Spt5* activity since *N30* failed to complement *Spt5* null alleles (P.I. Tsai and C.T. Chien, unpublished results). Male-specific recombination [1] was used to generate the *K24* allele. Male flies carrying *Fak56*^{KG}/*Sp Pin*; *TM3 Sb* Δ 2-3/+ were crossed with *Pin*/*CyO* females, and progenies of *Sp Fak56*^{KG}/*CyO* were further analyzed. Of 20 lines analyzed, 7 alleles retained the P-element insertion at the 5'-UTR of *Fak56*, suggesting a recombination event. Of them, the *K24* allele included a 13 kb deletion, from the 3' end of P-element to +1191 bp downstream of the *hts* transcriptional start site, which deletes *Fak56*, *CalpA* and *hts*. *K24* homozygotes were adult-viable. The viability is consistent with the report for a specific *Fak56* mutant [28], and the female-sterility could be due to the absence of *hts* activity [2].

(B) *Fak56* mRNA expression in late 3rd instar larvae examined by RT-PCR. *Fak56* mRNA expression was reduced in the *Fak56*^{N30/KG} hypomorphic mutant and absent in *Fak56*^{N30/K24} and *Fak56*^{K24/K24} null mutants. Expression of β *Tub* mRNA served as internal controls.

(C-D) NMJ 6/7 phenotypes shown by HRP-labeled axonal branches (magenta). Hypergrowth of NMJs is shown in *Fak56*^{CG1} (D), as compared to wild-type (C).

(E) Quantification of NMJ 6/7 bouton numbers in wild-type and *Fak56*^{CG1}. Note that a 22% significant bouton number increase is observed in *Fak56*^{CG1} as compared to wild-type.

(F) Clonal expression of *Fak56* RNAi induced by *hs-Flp; Actin > CD2 > GAL4 UAS-GFP* [3]. The clones expressing *Fak56* RNAi are marked with GFP. In clones expressing *Fak56* RNAi (green in F2), a reduction of *Fak56* expression (white in F1 and magenta in F2) can be detected (arrows).
